

Australian Geological Provinces, 2013.01 edition

This dataset consists of overlapping polygon geometries representing 287 geological provinces. Portrayal of all of these 287 provinces at once on a single map is not recommended. ESRI layer files (colour legends) are supplied which provide options for portrayal in ESRI GIS software using filtering of the dataset based on province type and age.

A summary group layer file - "Australian Geological Provinces 2013.01.lyr" - includes all of the individual type and age layer files. Users should load this layer file into ESRI GIS applications as an introduction to portrayal of the dataset.

The figure below shows an example of data layers in ArcMap using the "Australian Geological Provinces 2013.01.lyr" layer file.
